

Progress:

As a group, we created the frontend using react for each of the main pages (job page, meetup page, connections page, profile page). We used React-Router-Dom for navigation.

In the jobs page, there are three input fields: Job title, Company, and Location. Once these are inputted and submitted, a new item is created and saved with these inputs, and shown as a recommended Job posting for the user. The next feature to add here is to add a tags input field on the page, so the application can send the user's job posting to the people under the tag they have selected.

The Meetups page has three input fields: Event name, location, and date. These are used to filter events to find the one you are looking for/interested in. The next step for us here is to add the create an event component, so users can add events to the site.

The Connections page has an input field to filter connections by name. It also has components for individual connections. The next step is to complete the connections filter functionality, add tag update functionality, and add connect functionality.

The Profile page has 5 sections: Name, Pronouns, and Occupation; Bio; Resume; Network; Posts. Name, Pronouns, and Occupation and Bio are editable. The next steps are to allow the Resume to be updated, link the Networks section to the Connections page, and dynamically update the Posts section. Additionally, Posts section will be updated to reflect both posts a user has been tagged in, as well as posts a user has created.

Team Member Updates:

- Jayanth (Github Username: Jayanth-Samala)
Jayanth worked on the Meetups page.
- Daniyal (Github Username: daniyalbhat34)
Daniyal worked on the Connections page.
- Gabriel (Github Username: gab2CodingEdt)
Gabriel worked on the Profile page.
- We collectively worked on the Jobs page.
